AUTHOR: Dokuchayeva, O.D.

TITLE: Determination of spectrophotometric temperature and decrement of the Balmer series for AG Pegasi (1952)

PERIODICAL: Referativnyy zhurnal. Astronomiya i Geodeziya, no. 5, 1961, 23, abstract 5A162 ("Peremennyye zvezdy", 1960, v. 12, no. 5, 372 -373)

TEXT: Three spectrograms were used which were taken at the Abastumani Observatory by means of a 8 " camera with $F = 1$ m mounted on a 40-cm refractor and a 1595 prism. The mean absolute gradient was 1.46. The star temperature grew and amounted to $10,000 \pm 1,000^{\circ}\text{C}$ during the period of observations. The Balmer decrement values are cited in a table. It is noted that they do not agree with any variant of decrement calculations for planetary nebulae and Be stars. There are 5 references.

TITLE: On the increase of the sensitivity of photographic plates used in astronomy

PERIODICAL: Astronomicheskiy zhurnal, v.39, no.6, 1962, 1098-1101

TEXT: The Agfa Isopan ISS, Astropanchrome, Astro-unsensitized and special NIKFI astronomical plates were investigated. It was found that the sensitivity of these plates could be increased by: 1) preliminary exposure (1/15 sec) to white light (colour temperature of lamp 2850 °K, illuminance 0.18 lux); 2) single exposure to mercury vapour at 55 °C; 3) repeated exposure to mercury vapour; 4) exposure to mercury vapour followed by exposure to white light; 5) exposure to white light followed by exposure to mercury vapour. Analysis of the experimental curves shows that methods 1 and 2 have the maximum effect on the sensitivity. It was also found that the developed image can be intensified by the use of an iron-cobalt intensifier. Although no new details were found to appear, an appreciable

TITLE: Investigation of certain new developers

SOURCE: Ref. zh. Astronomiya, Abs. 6.51.112

REF SOURCE: Soobshch. gos. astron. in-ta im. P. K. Shternberga, no. 139, 1965, 37-50

TOPIC TAGS: photographic chemical, photographic processing, film developer

ABSTRACT: New developers were tested with four kinds of photographic plates manufactured by the Agfa company. These were the Metol-hydroquinone developers with the addition of hydrazine (0.2 gm/liter) and triazobenzene (0.1 gm/liter), the Phini-done-hydroquinone developer JD-67, and the Metol-phosphate developer MF. Sensitograms were obtained with the above developers in 2,4,8,16, and 32 min using the FSR-4 sensitometer. The kinetic development curves were graphed. The results are exhibited in the form of curves of sensitivity $S_{0,2}$ as function of the fog D_0 , and tables containing the entries of the sensitivity increase $S_{0,2}$ relative to that obtained with reference photographic plates developed with the Chibisov developer. It is noted that the addition of hydrazine somewhat increases the sensitivity of Astro photographic plates. For the Astro "special" and the Isopan ISS plates the best results were obtained with the hydrazine and triazobenzene developers. The addition of

Card 1/2

UDC: 522.617

ACC NR: AR6028751

only triazobenzene to the Chibisov developer caused the sensitivity of Kodak OaO plates to increase by a factor of 1.5. The Phenidone-hydroquinone and the Chibisov developers gave similar results. The Metol-phosphate developer MF gave a somewhat decreased sensitivity and very small values of γ but the fields with small density differences could be clearly distinguished. ABS. JOUR. : RZ5iol., No. 19, 1959, No. 87021

AUTHOR : Poluechayeva, I. I.
INST. : Azerbaydzhan Scientific Research Institute
. TITLE : Selected High-Yield Varieties of Corn for
Cotton-Growing Districts.

ORIG. PUB. : Byul. nauchno-tekn. inform. Azerb. n.-i.
in-ta khlopkovodstva, 1957, No 2, 21-26

ABSTRACT : Of the late varieties, those of highest yield
are VIR 156, Odesskaya 10, VIR 345, and local Agdumskaya;
of the foreign varieties were selected Pioneer 301, Pio-
neer 301-A, Pioneer 347, King-Cross KZ-5, and King-Cross
KC-5. For green fodder production were selected the
following varieties: Kartimera, Abashskaya yellow,
Gal'skiy 518, VIR 264, Kartuli-Krugi, North Dakota x
Dnepropetrovskaya hybrid, and local Shamkhorskaya. The
highest yield of grain was obtained with VIR 156, early
varieties of VIR 291, VIR 296, VIR 25, Kartuli-Krugi, and
Shamkhorskaya. -- A. F. Khlystova.

TITLE: The applicability of visible and infrared pyrometric methods to flame temperature measurement in a limited space

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Chernaya metallurgiya, no.9, 1961, 180-190

TEXT: Previous work has shown that the optical method of measuring flame temperature gives satisfactory results if the flame is homogeneous and steady. However, in actual flames, there are temperature gradients and periodic fluctuations of temperature with time. Two average temperatures are defined, one the arithmetical average and the other weighted with respect to gas density. The purpose of the present investigation is to study the applicability of optical and infrared methods to a closed flame as found, for example, in a metallurgical furnace. An apparatus developed by V.A. Krivandinyy is described, for measuring the mean optical temperature of a flame by the method of spectral line reversal. The temperature was measured of a

vertical flame in a combustion chamber (120 cm high, 70 cm wide) burning a mixture of town gas with air, which was open at the top and lined with refractory brick and water cooled. Mica windows were fitted from four sides to permit observation of the flame without allowing the drawing in of cold air. Mixing of the fuel and the oxidizer was by using a burner of the type "tube inside tube". The arrangement was such that it was possible to change over from a diffusion flame to a flame forming on combustion of a homogeneous mixture, i.e. from poor mixing to good mixing of the fuel and the oxidant. The length of the mixing pass could be varied between zero and 395 mm. Oscillograms of the fluctuations of ion current in a flame were recorded. Curves are reproduced in the paper showing the variation of flame temperature with excess air coefficient as measured in the optical and infrared regions. It was found that the optical method leads to substantial errors and has only limited applicability. The infrared method is more widely applicable and yields more accurate measurements. There are 5 figures and 7 Soviet-bloc references.

Title : Methods for the Fundamental Development of the Underground Transport.

Periodical : Mekh. Trud. Rab. Ed. 3, 28 - 31, Apr - May 1954

Abstract : Data on the development of the underground transportation system in the Karaganda and Donbass coal fields. Provisions necessary for the further development of underground transportation of coal are outlined and fully automatic remote controlled belt conveyers, bucket conveyers, and unloading operations are described. Tables; drawings.

AUTHOR: Dokukin, A. V., Professor, Doctor of Technical Sciences
(Lyubertsy, Moskovskaya oblast')

TITLE: Corrosion inhibition of structures and installations in the
exploitation of mineral resources

PERIODICAL: Gornyy zhurnal, no. 12, 1960, 31-35

TEXT: The author gives a survey of factors causing corrosion. Corrosion is extremely high in pits with acid water ($pH < 2$) and vagabond currents. The latter are connected with transportation by means of d.c. locomotives. The situation would be much improved with the use of a.c. locomotives. Such locomotives were developed by the Aleksandrovskiy zavod Permskogo sovnarkhoza (Aleksandrovsk Plant of the Perm' sovnarkhoz) and the author's association. The first experimental types are to be finished in 1961. Acidproof steels with 8% Ni, 17% Cr, and at most 0.12% carbon show long durability in highly aggressive pit waters. An increase of the Ni and Cr content, and an introduction of up to 0.8% of titanium, raises the durability of the alloy even more. Five devices made of plastics are

Card 1/4

Corrosion inhibition of...

S/127/60/000/012/003/005
B012/B054

described. They show comparatively high durability in aggressive medium and a lighter weight than metal devices. Glass-reinforced plastics show high tensile strength in aggressive media. Tubes and pipes are being made of such plastics. Mines in the Urals are using pipes which are lined with concrete (with acidproof cement) and coated outside with acidproof paint. Pipe flanges are made of acidproof OX18H9 (OKh18N9) steel. In highly aggressive waters, these pipes have a service life of 6-10 years. The author describes a rubber-lined valve for pressures of up to 70 atm excess pressure, a rubber-lined back-pressure valve with inclined seat, and a rubber-lined suction valve. Fig. 6 shows an acidproof vacuum pump of the type PMK-3 (RMK-3) which had been demonstrated in 1960 at the Corrosion Inhibition Show of the Vystavka dostizheniy narodnogo khozyaystva v Moskve (Exposition of Achievements of National Economy in Moscow). It is protected from aggressive media under heavy duties. The front parts of the cast-iron body are lined with Viniplast or faolite. The conduits are made of Viniplast. Enamelled chutes used in the breakage faces of the pits of the Luganskiy sovnarkhoz (Luganskoye sovnarkhoz) for the transport of ore and coal proved to be highly resistant to wear and corrosion. The following pure metal coats are recommended for corrosion

Card 2/4

B012/B054

Corrosion inhibition of...

inhibition: 1) in mine atmosphere: zinc layer of up to 40μ , under severe conditions: lead layer of up to 100μ ; 2) in neutral water: zinc layer of up to 70μ ; 3) in alkaline mine water: nickel layer of 20 - 100μ ; 4) in acid mine water: lead layer of 1-2 mm and more. Non-metallic coats used in acid mine waters should have the following thicknesses: acidproof cement: 10-12 mm, faolite, rubber, textolite, polystyrene: 3-5 mm, "cast stone": 15-25 mm. There are 6 figures and 3 tables.
